

Cover letter

Dear Editors,

Please consider “Reading-frame constraints and retained RG content in NR4A3 fusion models of extraskeletal myxoid chondrosarcoma” as an Original Research Article in Cancer Genetics.

This computational study reconstructs four sourced NR4A3 fusion junctions at transcript level, resolves reference-model reading-frame constraints, and places retained RG content on a published axis while distinguishing breakpoint models from the measured construct. It also reports the retained symmetric TCF12 composition comparison. No recruitment experiment or ATR-inhibitor-response test was performed, and patient-junction confirmation remains necessary.

The scientific content is unchanged from the existing Research Square submission rs-10988531, currently in prescreening. This journal package supplies editable text and tables, a structured abstract, separate supplementary tables and original figure files. It does not create a duplicate preprint submission or claim that the preprint is publicly posted.

We request the standard subscription route with online-only color and no optional paid open-access or accelerated service. Funding, interests and AI assistance are disclosed in the manuscript.

Sincerely,

Tristan D. McRae
