

Dependency inside and outside sarcoma

PRMT5 and MAT2A are dependencies in almost every sarcoma line and in almost every non-sarcoma line, so growth inhibition on silencing them is expected and the panel supports no statement of tissue selectivity; only an effect on fusion-driven transcription would be specific to this disease. MTAP is not a dependency in either group, which is the profile of a biomarker rather than a target. No EMC line is present in this panel, so every value is inferred from other sarcomas.
