

GSE24369 / GPL6244 - every deposited class separately

LGFMS carries FUS::CREB3L2 and is therefore a within-class control for a FET-fusion sarcoma. Solitary fibrous tumour is drawn because it is deposited in this series; it is not in the comparator arm, because the sample classifier carried no pattern for it. The two pooled skeletal-muscle references are normal tissue, are drawn as triangles, are not a comparator, and read above EMC on PRMT5. Pooled, EMC ranks third of five, below desmoid fibromatosis and solitary fibrous tumour. On PRMT5 alone EMC has the highest class median, and 9 of 34 comparator tumours read at or above the lowest EMC tumour. Left-panel points are gene-by-sample values pooled across four genes, so they are not independent observations and no test is run on them.
