

EWSR1, 656 aa - 11 GRG sites (ticks), first at 301; RGG-rich regions shaded darker

wild type

*no GRG site in residues 1-300
(the segment every fusion retains)*

EWSR1::NR4A3 type 1

EWSR1::NR4A3 type 2

EWSR1::NR4A3 type 5

EWSR1::FLI1 (Ewing, type 1) EWSR1 e7

EWSR1::ATF1 (clear cell, commonest type) EWSR1 e8

EWSR1::ATF1 (clear cell, further reported) EWSR1 e7

EWSR1::ATF1 (clear cell, further reported) EWSR1 e10

any breakpoint in residues 321-462 keeps exactly 4 sites
(142 residues, 22% of the protein)

Solid bars are EMC fusions, hatched bars comparator fusions. EWSR1::FLI1 retains no sites and PRMT5 inhibition is nonetheless fusion-dependent there, so the motif is not required and this figure is not a response predictor.
