

Designing a medicine for a rare cancer — on a computer

The cancer is driven by one broken protein. The plan: **throw that protein in the bin.**

THE PROBLEM

Stuck "on"

One protein is jammed on, driving the tumour.

WHY IT'S HARD

No keyhole

Normal drugs need a pocket. This one is shut.

THE IDEA

Bin it

A "degrader" hands it to the cell's trash.

THE FIND

Door flickers open

Simulations: it cracks open
~1 in 4 moments.

MAKE IT SAFE

Hit only the bad one

Spare its near-identical twins.

All done **on computers — no lab yet.** It's a blueprint built to prove the idea's worth testing for real.
