

Transcriptome load per junction gapmer against chance expectation

50 distinct oligonucleotides at real exon junctions, ranked; exact plus ≤ 1 -mismatch matches over 186,185 transcripts.

◆ 41 of 50 fall at or below the chance upper bound. Marked: the 5 designs spanning 3 partners' seams — one molecule, plotted once, not 3 times.

Chance band assumes independent uniform bases over an assumed transcriptome span; it separates "more than chance" from "at chance" and is not a significance test.

Counts are predictions from sequence search, not measured off-target activity. 9 of the 50 plotted designs exceed the band.

Not plotted: 10 designs at 2 modelled breakpoints rather than real exon junctions; 4 of those exceed the band, at 16–95 matches and 75.0–81.2% GC.
