

Frame compatibility across the NR4A3 fusion junction space

231 donor-exon × acceptor-exon pairs graded over 5 partners; 38 are frame-compatible, and all of them lie in one acceptor column. The grid is continued in the right-hand panel; the three acceptor columns repeat in both.

frame-compatible, panel emitted (38)

out of frame (39)

acceptor exon carries no coding sequence (77)

acceptor outside plausible resumption range (77)

Frame compatibility is an arithmetic property of exon structure. This is not a claim about which junctions patients carry: breakpoint recurrence is a clinical observation, and no partner-and-exon-resolved series exists for most of this space.
