

The methylosome against each comparator class separately — GSE24369 / GPL6244

NOTE LGFMS is FUS::CREB3L2 - a FET-fusion sarcoma, and therefore a control for 'this is just what a fusion sarcoma looks like'. A pooled comparator arm makes that control invisible. Δ Points are gene-by-sample values pooled across the four methylosome genes, so they are not independent observations and no test is run on them here.
